

Flood Impact Analysis

A preview of the ArcGIS Pro Solution Template

Gert van Maren

Floods are the most common natural disaster in the United States. Failing to evacuate flooded areas, entering flood waters, or remaining after a flood has passed can result in injury or death.

Source: U.S. Department of Homeland Security, Ready.gov

Issues in Flood Planning

Many communities don't have a systematic process to analyze the potential impact of flood events on critical assets

- Lack of predictive modeling capabilities to help create a flood response plan
- Ineffective methods of communicating flood impact severity to stakeholders
- Difficulty of getting useful flood depth data during the event causes information latency
- Lack of actionable information results in chaotic response
- Reactive approach costs lives and results in severe economic impact
- Difficulty in securing funding for flood mitigation projects due to inadequate flood impact analysis

Issues in Flood Planning

Many communities don't have a systematic process to analyze the potential impact of flood events on critical assets

- Lack of predictive modeling capabilities to help create a flood response plan
- **Ineffective methods of communicating flood impact severity to stakeholders**
- Difficulty of getting useful flood depth data during the event causes information latency
- Lack of actionable information results in chaotic response
- Reactive approach costs lives and results in severe economic impact
- **Difficulty in securing funding for flood mitigation projects due to inadequate flood impact analysis**

Flood Impact Analysis

ArcGIS Pro template for analyzing and visualizing flood impact

- Better understand flood impact

- Make it easier to communicate flood risk

“3D analysis of bridges, roads and low water crossings is a critical piece to our capacity to provide information that will save lives in the future.”

David Maidment

The University of Texas at Austin

Home ▾ **Austin Onion Creek Flooding Simulation** + ▾ [Icons] ... ▾ Gert van ▾

Austin Onion Creek Flooding Simulation Choose Flood Level 0 1 2 3 4 5

When preparing for emergencies, for example when developing flood response plans, identifying flood risk, locating at risk critical infrastructure and especially communicating with the public, 3D visualization can add tremendous value to your organization.

3D maps (scenes) make it much easier to communicate the risk out to local floodplain and hazard mitigation planners, decision makers and the public.

This dashboard is a first prototype of a web app allowing the user to step through different flood events and see the impact in the panel on the right hand side.

How to use:

- select a flood level in the 3D scene by clicking on the bookmarks at the bottom.
- select the same flood level in the upper right of the dashboard.

Affected buildings 🏠 1,282 <small>Last update: 3 minutes ago</small>	Loss potential 💰 \$33.037M <small>Last update: 3 minutes ago</small>
Bridges to watch 84 <small>Last update: 3 minutes ago</small>	Flooded bridges 36 <small>Last update: 3 minutes ago</small>
Roads < 1m 🚶 24 <small>Last update: 3 minutes ago</small>	Roads 1-2m 🚶 33 <small>Last update: 3 minutes ago</small>
Roads 2-3m 🚶 23 <small>Last update: 3 minutes ago</small>	Roads > 3m 🚶 26 <small>Last update: 3 minutes ago</small>

The features in red are the

Why Water Depth Matters

~1 Foot

Response focused on those who need additional assistance

~3 Feet

Near the limit to use High Profile Vehicles to perform high water rescues

~6 Feet

Boats and helicopters now required to perform high water rescues

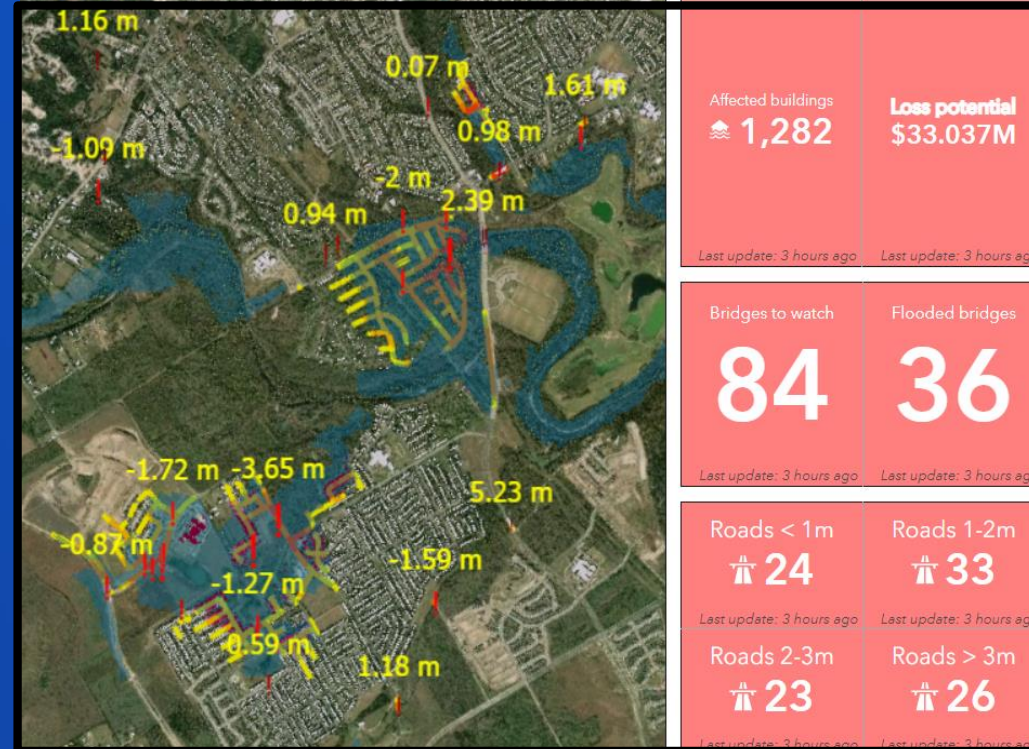

~9 Feet

1st Floors completely inundated

**“How many helicopters, boats, and high profile vehicles and where to send them”
– Texas State Operations Center**

How can it be used in Flood Planning?

- Define flood impact areas at each flood stage
- Determine what assets will be impacted and by how much
- Communicate the results of the analysis to community stakeholders
- Prepare hard-copy operations maps for first-responders on scene

Operational Map

Description: South Austin: Onion Creek

Department of Emergency Management
Flood Response Planning

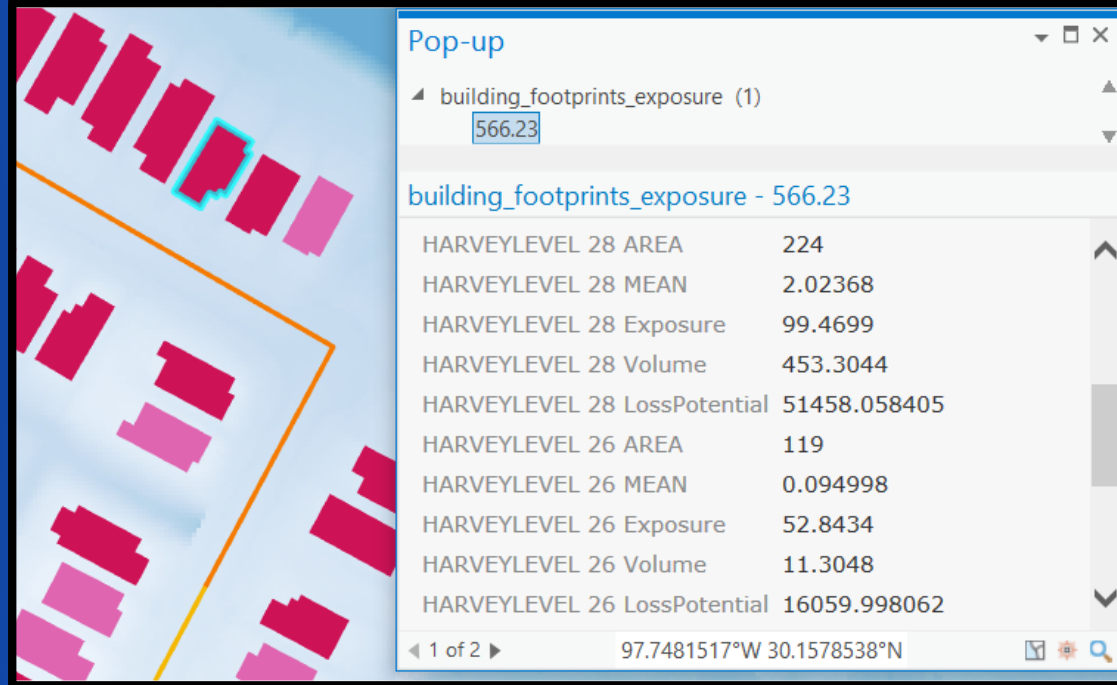

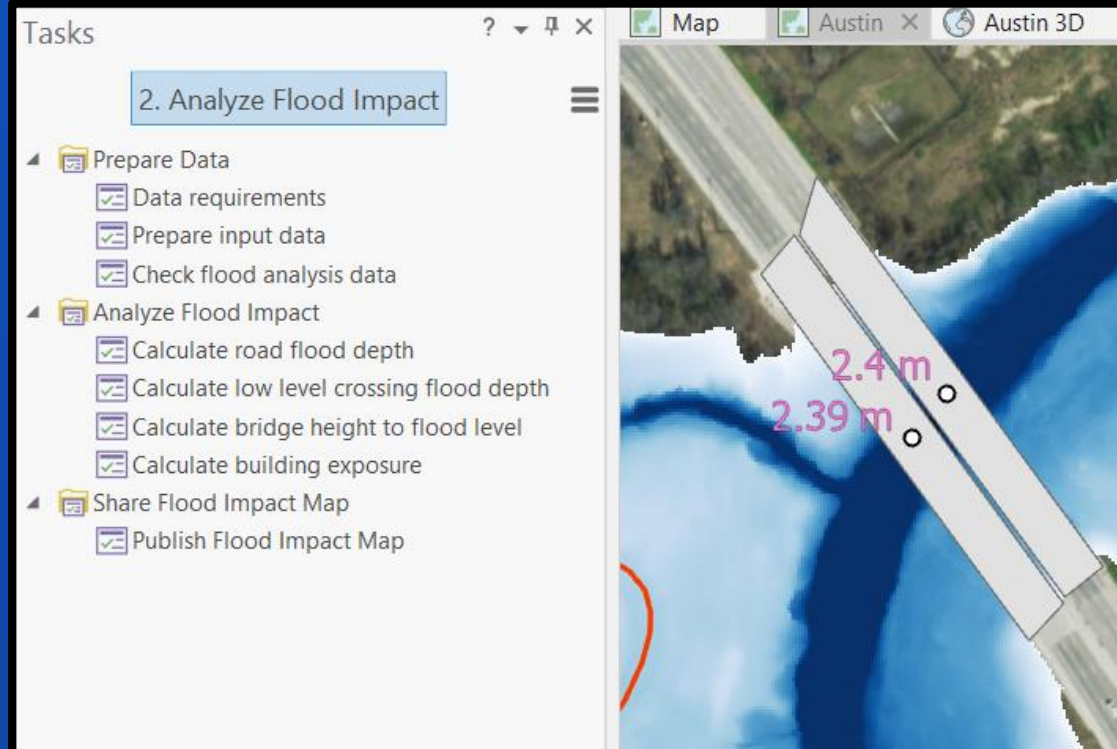

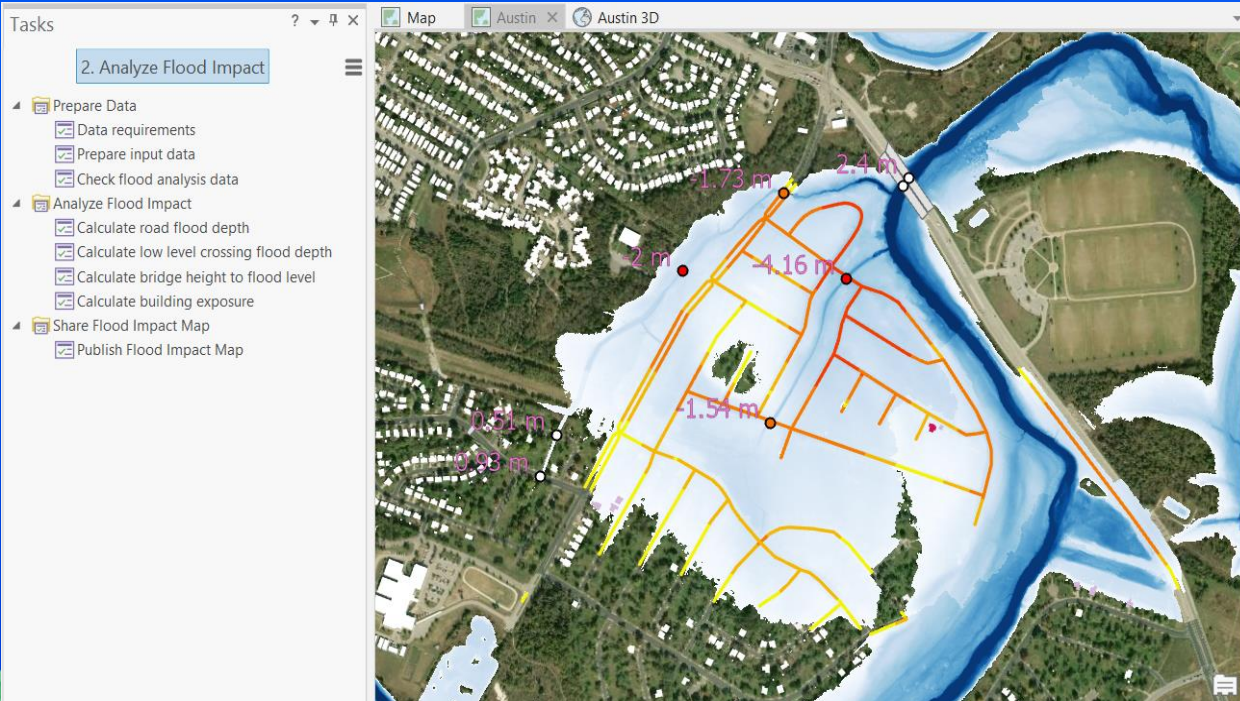

0 0.2 0.4 0.8 1.2 1.6 kilometers

How does it work?

Flood Impact Analysis - Preview 2 Overview

The Flood Impact Analysis solution template can be used to visualize and assess the impact of flooding events on the existing landscape.

Desktop Application Template by [awesome3D](#)

Created: Jul 3, 2019 Updated: Jul 3, 2019 Number of Downloads: 1

Description

The Flood Impact Analysis solution template can be used to develop flooding scenarios and visualize the impact on the existing landscape. It leverages flood depth data to analyze the impact of flood events on critical assets such as buildings, bridges, low water crossings and roads. It also can be used to create compelling 3D visualizations that make it easier to understand and communicate the real impact of flooding events.

Any type of flooding is supported including, sea level rise, riverine, storm surge and lake flooding. Below are some examples of the solution template output:

[Riverine flooding Onion Creek, Texas dashboard](#),
[Sea level rise, Baltimore dashboard](#)
[Lake Flooding, Queenstown, NZ](#)

The solution template consists of several tasks that allow you to:

- prepare the flood input data,
